

Splix: third-party services

The outside companies and services Splix depends on, and what each one does for us. Prepared 1 October 2026 from the current code (server, mobile app and admin panel).

Services we depend on

Service	What we use it for	Used by
MongoDB Atlas	The database. Holds all app data: users, groups, expenses, chats, tasks, reminders and trips.	Server
Render	Hosts the server (API) that the mobile app talks to.	Server
Cloudinary	Stores the photos and files people upload in the gallery and in chat.	Server
Resend	Sends every email: verification code, password reset code, welcome email and the password-changed notice.	Server
OpenAI	Writes the AI trip plans (itinerary). If it is not set up, the planner says it is unavailable and the rest of the app keeps working.	Server
Stream (getstream.io)	Runs the voice and video calls.	Server and mobile app
Google Sign-In (Google Cloud)	Lets people sign up and log in with their Google account.	Server and mobile app
Expo Push Service	Sends push notifications from our server to phones. It passes them on to Google (Android) and Apple (iOS).	Server and mobile app
Firebase Cloud Messaging (Google)	Delivers the push notifications to Android phones. Used through Expo, under our Firebase project.	Mobile app (Android)
Expo Application Services (EAS)	Builds the installable mobile app in the cloud.	Mobile app builds
Google Fonts	The admin panel loads its text font (Inter) from here.	Admin panel

The keys for Resend, OpenAI, Cloudinary, Stream and Google Sign-In can be managed in the admin panel under General Settings > Third-Party APIs.

Also worth knowing

Name	What it is	Used by
WhatsApp, X (Twitter), SMS, email	Invite a friend: the app opens the chosen app with a ready-made invite message. We have no account or key with them, and nothing is sent until the person presses send.	Mobile app
Metronic (KeenThemes)	The design template the admin panel is built on. A purchased licence, not an online service.	Admin panel
TinyMCE	The text editor used to edit email templates. Bundled inside the admin panel under its free GPL licence; it does not contact TinyMCE's servers.	Admin panel

Not in use today: there is no payment provider, no analytics or crash-reporting service, and no maps service. Chat runs on our own server. The iPhone app is not set up yet; when it is, Apple's push notification service will be added for iOS notifications.
